

Adhese 2.0.32

Announcement

The spreadsheet and PDF reports on the campaign [Documents tab](#) will be deprecated in one of the future releases, as they are not compatible with the new metrics that will be introduced. These reports will be replaced by a new report which contains all the information that is present in the current documents.

New features

- Added new country inventory API with country info. For documentation, see [Country inventory](#).

Improvements

- To make it more easy to select all the sites of a specific publisher in the [Datamine screen](#), the publisher's name is now added before the site name in the drop-down menus.
- Added new column with the creative's format name to the [Per creative per day report](#).

A column was inserted between existing columns. This may affect automated processes that use the Per Creative per day report.

- Forecasting is now automatically updated for all target combinations currently in use.
- Order upload gets rejected if the quote field of a publisher is not filled in. For more information, read [Create a new publisher and Manage campaigns and bookings over XML format](#).
- It is now possible to configure the header background color of Excel reports.
- Added IDs for publications, formats and/or locations to default alerting template
- The date format has changed when downloading an active ratecard over API. The format is now DD-MM-YYYY. See [Download active ratecard](#).

Issues

- Fixed possible issue in unlinking duplicated 'all together' bookings
- Added subformat column and sorting to positions overview (admin screen)
- Improved sorting tables on dates
- Improved graph display on booking screens
- Added validation to trafficking weights, disallowing zero weights for trafficking creatives to bookings
- Added empty/stacked impressions to Monthly inventory report (datamine)
- Duplicated ratecards are now named "Copy of..."
- Link to Adhese configuration has been removed from the admin screen
- Renamed 'Position search' and 'Add wave' dialogs in Booking screens

Internal

- Database structure modified to prepare for new log data
- Improved logging of actions from order upload xml
- Added reporting on the completion of reports
